ACADEMIC PROJECT

M.E

Project Name : Improving Security and Throughput in Wireless Mesh Network

Duration : March-April '2012

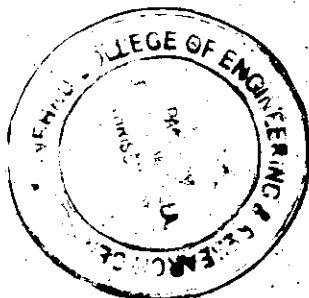

Project Description : This project is used to improve the security and throughput in wireless mesh network by making use of accusation based technics. Here, we propose intrusion detection methods, to support ODMRP, which mitigates the attackers and ensuring higher throughput and security. Our approach to defend against the identified attacks combines measurement-based detection and accusation-based reaction techniques. The solution accommodates transient network variations and is resilient against attempts to exploit the defence mechanism itself.

PROJECTS

Academic Project (P.G)

Phase1 : Co-Design of Scheduling Real Time Embedded System

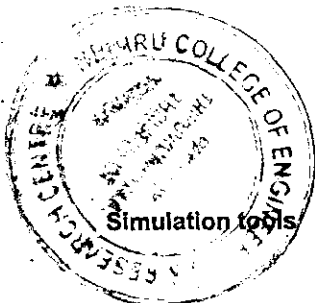

This thesis presents the co-design, simulation implementation of event scheduler & timer services provided by the real time operating system in a FPGA. The hardware based event scheduling functionality liberated the CPU from performing the overhead processing associated with managing event queues and provided microsecond resolution scheduling of events in java optimized processor (JOP).

Phase2

: Optimized Adaptive Viterbi Decoding of Convolution Codes over a Memory less channel.

Unlike Viterbi algorithm, AVA needs small average number of computation but this variation is exponentially distributed, leading to modest size of input buffer. Hence probability overflow by cumulative addition of hamming distances of metric path. For certain value of 't' clock cycles, the minimum hamming distance value is deducted with other hamming values there by reducing probability overflow. The hardware requirements of decoder grow predictably then in exponential as standard Viterbi algorithm.

Mini Project

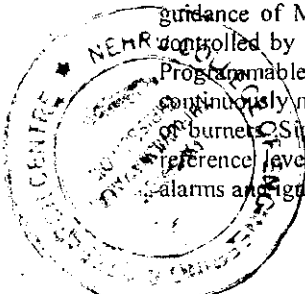

□ Title : ICU SECURITY SYSTEM

It is an advanced security system that can be implemented in hospitals to help doctors and nurses. The ICU door is protected from unauthorized permissions by a password protected door lock. System checks the status of the patient's data such as temperature, pulse rate and drip level. When the body temperature exceeds a certain limit or if there is any abnormality in pulse rate, a message "attend urgently" is displayed in LCD. Similarly, as drip level goes low LCD shows "attend urgently" along with an alarm.

Main Project

□ Title : BURNER AUTOMATION USING PLC

We have done this project in Kerala Minerals and Metals Ltd (KMML), Kollam under the guidance of Mr .Ajan (plant engineer, KMML) .The burners in Acid Regeneration Plant are controlled by relay logic. To overcome the draw backs of relay logic we are converting this to Programmable Logic Controller (PLC).For the proper functioning of burners we have to continuously monitor the flow rate of oil, gas etc into burners and also pressure and temperature of burners. Signals from various sensors are fed to the PLC, which compares these inputs with reference level and transmits corresponding control signals to various output solenoid valves, alarms and ignition transformer .A ladder diagram is created for the process control.

Mini Project

Title : GAS LEAKAGE DETECTION

The heart of the application is a TI MSP430F2619. The project monitors the temperature, and presence of LPG in the air. In case of no leakage a green LED blinks. If LPG is detected an "alert" message is displayed in LCD along with a sound alarm.

Main Project

Title : EFFECT OF RANDOM DOPANT FLUCTUATION ON 3D MOSFET CHARACTERISTICS

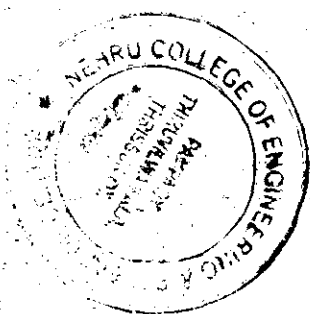

I have done this project in VSSC, Trivandrum under the guidance of Dr. Sreeal S (Scientist/Engineer, BSED/AVN). Intrinsic process variability is broadly considered as one of the main factors limiting complementary metal-oxide semiconductor (CMOS) technology scaling. Random dopant fluctuation (RDF) is a form of process variation resulting from variation in the implanted impurity concentration and its position. At present there is no analytical model for studying RDF effects in 3D MOSFET such as FinFET. This project aimed to propose a novel analytical model for threshold voltage variation due to RDF. The idea was to extend the model of bulk MOSFET to FinFET by considering it as a double gate device.

Brief description: Due to increase in automobiles usage, it is very difficult to park the four wheelers in the city area such as in shopping complexes, hotels, markets, etc. So we consider the above major problem into account and made this innovative concept of "FOUR WHEEL STEERING" which is used for easy parking. Here all the four wheels of the vehicle will turn either left or right (same direction) up to 90 degrees (i.e. exactly at right angles). This makes the vehicle to park easily in crowded places.

RESPONSIBILITIES:

- Detailed Analysis of the working of Four Wheel Steering
- Involved in design of the complete mechanical components for the Project.
